

What is the range of “normal” when it comes to breastfeeding?

How often and how long?

4–13

Number of breastfeeding sessions in a day

12–67 minutes

The infants assessed for this study were:

- | 1–6 months of age
- | Perfectly normal full-term infants
- | Exclusively breastfeeding on demand
- | Growing according to the WHO growth charts

How much?

Infants will drain the breast once a day, but usually they feed to appetite and stop feeding when they have had enough or want to change to the other breast.

67%

An average breastfeed removes 67% of the milk from the breast

12–67 minutes

Average duration of a breastfeeding session

| From a single breast, the average volume an infant drinks is 75 mL (range: 30–135 mL)

| It is normal for one breast to produce more milk than the other

One breast or both?

Infants have varied feeding patterns:

- | 30 % always take just one breast
- | 13 % always take both breasts, and
- | 57 % mix it up!

| The majority (64 %) of infants breastfeed day and night

| These infants spread their milk intake evenly throughout the 24 hours

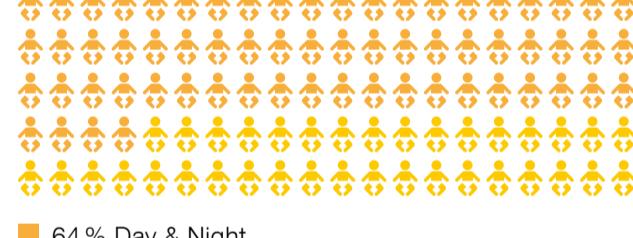

30 % one breast

13 % both breasts

57 % mixed

Night feeding is normal

64 % Day & Night

36 % Day only

| Only 36 % of infants don't feed at night (10 PM to 4 AM)

| These infants have a large feed in the morning

28 % Morning

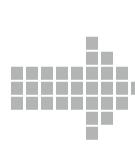

28 % Afternoon

24 % Evening

20 % Night

Do boys and girls drink the same?

831 mL

Average daily amount taken by boys

755 mL

Average daily amount taken by girls

The range of normal...

478–1356 mL

Range of daily milk intake of exclusively breastfed infants who are growing according to the WHO charts.

Breastfed infants are indeed getting enough milk. As infants get older, they take fewer, shorter, larger feeds but their 24-hour (daily) intake will remain the same.

Between 3 and 6 months infants grow more slowly and have a relatively lower metabolic rate, so they don't need more milk.
